Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-APR-2001
                                                                                                                                Ношо
    The invention features to sectered and minorante associated with interpretation and polymucleotides. The sequences of the invention are useful in diagnostic assays for detecting diseases associated with inappropriate cativity or lavels of these polymucleotides, and in identifying their agonists and antagonists that are potentially useful in therapy. The sequences of the invention are useful for inducing (minorances of the invention are useful for cativity cancers, infections, autoimmune disorders, haematopoietic disorders, wound healing disorders, cholesteryl ester storage disease, inflammation, congenital muscular dystrophy, junctional epidermolysis of inflammation, congenital muscular dystrophy, junctional epidermolysis curl and bacterial infections, Huntington's disease, asthma, arthritis, alergies, schizophrenia, sbg442445PROa-associated disorders, viral and bacterial infections, Huntington's disease, transplant rejection, capticaemia, psoriasis, inflammatory bowel disease, transplant rejection, graft verse host disease, ischemmia, stroke, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone disease, atherosclerosis, brain disorders and alleep disorders, cardiovascular diseases including parasupranuclear pally, myotonic dystrophy, depression, anxiety disorders and alleep disorders, cardiovascular cespiratory diseases including congestive heart failure and myocardial infarction, respiratory diseases including chronic obstructive pulmonary disease, and non-viral hepatisis, type II diabbetes mellitus, renal disease including conception control esterolaemia, hypertriglyceridaemia, cirrhosis, viral cand non-viral hepatisis, type II diabbetes mellitus, renal disease including conte and chronic renal failure, glomerulonephritis, gastrointeefinal diseases including hypersolaemia, skeletal muscle disorders including hypersolaemia, skeletal muscle disorders including hypersolaemia, skeletal muscle disorders including hypersolaemia, epidemia, special propried in the propried including lymphoma, tes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

```
The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome
                                                                                                                                                                                                                         Peyman JA;

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, mootropic, antoidabetic, antidabetic, and may have a use in gene therapy, and as a vacine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the edicament for treating a syndrome associated with a human disease. The medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzahimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are turbar used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 NGVHEGGYYQFVIPDLSPKNKSYCGTQSEYKPPIYHFYSHIVSNDTTVIVKNQPVNYSFS 120

X New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

XX Example 48; SEQ ID NO 1058; 1880pp; English.

XX The invention relates to a novel isolated polypeptide (NOVX). A colypeptide of the invention has cytostatic, immunomodulator.

C polypeptide of the invention has cytostatic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a colypeptide are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the corporation. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The medicament for treating a syndrome associated with a human disease. The

hypotensive, antiarteriosclerotic, anorectic, gene therapy, NOV60A;
          treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dysliptideamias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences. The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. NOV60 is a beta tectorin-like protein and its coding sequence maps to chromosome

ö New NOVX polypeptides and nucleic acid molecules useful for preventing c treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

Example 48; SEQ ID NO 1056; 1880pp; English

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, notation polypeptide of the invention has cytostatic, antidiabetic, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polymucleotides comprising or prolypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polymucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, alzahamer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are typing, preventive medicine, and pharmacogenomics. The present sequence typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4-JUN-2002
                                                                                                                                                                                                                                                                                          11-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                                      11-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .7-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .9-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                    1-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4-JUN-2
                           The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, polypeptide of the invention has cytostatic, immunomodulator, neuroprofective, nootropic, antidiabetic, and may have a use in gene therapy, and as a contining any polypeptide squences given in the appoint of the 303 fully defined nucleotide sequences given in the specification. The polypeptide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive mediciane, and pharmacogenomics. The present sequence typing, prevents a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     197

The invention describes a novel polypeptide-cytochrome b45.65 (I), its encoding polynucleotide (II), the production of (I) using DNA recombination technology. Also described are an antagonist for resisting therapeutic action of (I) and the application of (II). (I) is used to treat several diseases, such as mailgnant tumour, haemopathy, Human immunodeficiency virus (HIV) infection, immunological disease and various inflammations. This is the amino acid sequence of the novel cytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        66 GGYYQFVIPDLSPKNKSYCGTQ-----SEY----KPPIYHFYSHIVSNDTTVIVKN 112

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anotectic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anocetic, antidiabetic, antimicrobial, and neuroprotective, nootropic, anocetic, antidiabetic, antimicrobial, and neuroprotective, nootropic, and easy have in the record of a new of the 303 fully defined nucleotide sequences given in the comprising any of the 303 fully defined nucleotide sequences given in the medicament for treating a syndrome associated with a human disease. The polypeptide, polymucleotide and antibody are useful in diagnosing, treating or preventing Nova-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obssity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are turther used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         137 RVATVHVKNGSMGTFESQLSLNFYTNAKFSIKKEAPFVLEASEIGSDLFAGVEAKGLSIR 196

This sequence represents rat uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and assaying the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a dispansis of a disease or a predisposition to contract a disease within the patient. The method also comparises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases, e.g. medullary cystic kidney disease 2 (MCKD2), familial juvenile gouty nephropathy (FUGN), renal failure, hyperuricaemia, gouty
                     medullary cystic kidney disease 2; MCKD2;
familial juvenile gouty nephropathy; FJGN; renal failure; hyperuricaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  76 LSPKNKSYCGTQSEYKPPIYHFYSHIVSNDTTVIVKNQPVNYSFSCTYHSTYLVN-QAAF 134

This sequence represents murine uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and saying the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a disposit of a disease or a predisposition to contract a disease within the patient. The method also comprises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases, e.g. medullary cystic kidney disease 2 (MCKD2), familial juvenile gouty nephropathy (FUGN), renal failure, hyperuricaemia, gouty
                                                                                                                                                                                                                                           human; bovine; murine; rat; uromodulin; UMOD; assay; detection; mutation; wild-type; diagnosis; renal disease; predisposition; medullary cystic kidney disease 2; MCKD2; familial juvenile gouty nephropathy; FJGN; renal failure; hyperuricaemia; gouty arthritis; enuresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing renal diseases or a predisposition to renal diseases, e.g. renal failure, hyperuricemia, gouty arthritis or enuresis comprises assaying a genetic material to detect a mutation in at least a copy of the uromodulin genetic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 223.5; DB 8; Length 642; Pred. The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals
                                                                                                                                                                                                                556

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A purucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, developmental disorders, endocrine disorder, neurological disorder, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite or generation minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.thm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      381 VTPARDGPCGTVLT-RNETHATYSNTLYLADEIIIRDLNIKINFACSYPXDMKVSLKTAL 439

This sequence represents bovine uromodulin (UMOD). The cDNA encoding this sequence was used in the method of the invention for diagnosing a disease or a predisposition to contract a disease. The method comprises obtaining genetic material from a test subject and assaying the genetic material to detect a mutation in at least a copy of the UMOD genetic sequence, where the presence of a UMOD mutation supports a diagnosis of a disease or a predisposition to contract a disease within the patient. The method also comprises comparing the sequence of the genetic material of the sequence of the wild-type UMOD gene and identifying any differences between the sequence of the genetic material and the wild-type UMOD gene. The method is useful for diagnosing renal diseases or a predisposition to renal diseases. e.g. medullary cystic kidney disease 2 (MCKD2), familial juvenile gouty nephropathy (FJGN), renal failure, hyperuricaemia, gouty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     188 VEAKGLSIRFKVVLNSCWATPSADFMYPLQWQLINKGCP--TDETVLVHENGRDHRATFQ 245

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 726,

Modular matrix proteins of the inner ear homologous to components of the sperm-egg adhesion system."; J. Biol. Chem. 272.8791-8801(1997).

-I-FUNCTION: One of the major non-collagenous components of the tectorial membrane is an tectorial membrane (By similarity). The tectorial membrane is an extracellular matrix of the inner ear that covers the extracellular matrix of the inner ear that covers the neuroepithelium of the cochlea and contacts the stereocilia bundles of specialized sensory hair cells. Sound induces movement of these hair cells relative to the tectorial membrane, deflects the stereocilia and leads to fluctuations in hair-cell membrane

```
potential, transducing sound into electrical signals.
-!-SUBUNTY: May form homomeric filament after self-association or heteromeric filament after association with alpha-tectorin.
-!-SUBCELULAR LOCATION: Attached to the membrane by a GPI-anchor (Probable). Found in the non-collagenous matrix of the tectorial membrane (By similarity).
-!-DOMAIN: Zona pellucida domain may enable to form filaments.
-!-PTM: The presence of a hydrophobic C-terminus preceded by a potential cleavage site strongly suggests that tectorins are precursors. Tectorins are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into the extracellular compartment.
-!-SIMILARITY: Contains 1 ZP domain.
                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. "Molecular markers for cell types of the inner ear and candidate genes for hearing disorders".

Fro. hearing disorders".

Fro. Natl. Acad. Sci. U.S.A. 95:11400-11405(1998).

-!- FUNCTION: One of the major non-collagenous components of the tectorial membrane The tectorial membrane is an extracellular matrix of the inner ear that covers the neuroepithelium of the cochlea and contacts the stereocilia bundles of specialized sensory hair cells. Sound induces movement of these hair cells relative to the tectorial membrane, deflects the stereocilia and leads to fluctuations in hair-cell membrane potential, transducing sound into electrical signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: N-glycosylated.

PTM: The presence of a hydrophobic C-terminus preceded by a potential cleavage site strongly suggests that tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound specursors. Tectorins are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into the extracellular compartment.
                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBLUIT: May form homometic filament after self-association or betcomeric filament after association with alpha-tectorin. SUBCELLUIAR LOCATION: Attended to the membrane by a GPI-anchor (Probable). Found in the non-collagenous matrix of the tectorial membrane (By similarity).

TISSUE SPECIFICITY: Exclusively expressed in the inner ear, where it is found in basilar papilla, clear cells, supporting cells, cuboidal cells and the lagena macula.

DOMAIN: Zona pellucida domain may enable to form filaments.

PTM: N-glycosylated.

Mus musculus 12 days embryonic body between diaphragm region

and neck cDNA, RIKEN full.length enriched library, clone:9430016A21

Broduct:hypothetical Endoglin / CD105 antigen containing protein, full

Brisert sequence (Mus musculus 16 days embryo head cDNA, RIKEN full-

Brisert sequence (Mus musculus 16 days embryo head cDNA, RIKEN full-

Brodoglin / CD105 antigen containing protein, full insert sequence)

Endoglin / CD105 antigen containing protein, full insert sequence)

Entrigen containing protein, full insert sequence)

Battigen containing protein, full insert sequence).

 Isoid=008523-2; Sequence=VSP 010557;
TISSUB SPECIFICITY: Cochlea-specific.
DOMAIN: Zona pellucida domain may enable to form filaments.
PTM: 3 products of tectorin seem to exist: HPM, MPM and LAMM. They may be generated by active processing or the result of proteolysis occurring between intrachain disulfid bonds.
PTM: The presence of a hydrophobic C-terminus preceded by a
 potential cleavage site strongly suggests that tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound precursors. Tectorina are targeted to the apical surface of the inner ear epithelia by the lipid and proteolytically released into

Gene Expr. 4:63-75(1994).
-!- FUNCTION: Not known. May play a role in regulating the circulating
activity of cytokines as it binds to IL-1, IL-2 and TNF with high
 SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor, then cleaved to produce a soluble form which is secreted in urine. TISSUE SPECIFICITY: Apical vesicles in kidney thick ascending limb of Henle (TALH) cells.

SIMILARITY: Contains 3 EGF-like domains.

SIMILARITY: Contains 1 ZP domain.
